Professional Summary

Information Technology undergraduate with a strong foundation in Software Engineering and DevOps, specializing in full-stack application development, Clean Architecture, and cloud-native systems. Hands-on experience developing robust backend services and high-throughput APIs alongside building automated CI/CD pipelines, containerized environments, and scalable infrastructure on AWS. Focused on applying sound engineering principles and DevOps automation to deliver clean, maintainable, test-driven, and highly reliable systems with strong performance and observability.

Education

University of Moratuwa 2024 – Present
BSc (Hons) in Information Technology – GPA: 3.6

H/North Kanumuldeniya National School 2008 – 2022
G.C.E. Advanced Level (Combined Mathematics, Physics, ICT) – AAB | Z-Score: 1.79
G.C.E. Ordinary Level – 8A 1B

Technical Skills

Languages: TypeScript, JavaScript, Python, Go, SQL, Bash
Backend Development: Node.js, Express.js, Bun, Hono, FastAPI, RESTful APIs, WebSockets
Frontend Development: React, React 18, Vite, Tailwind CSS, HTML5
Databases & ORM: PostgreSQL, MySQL, SQLite, MongoDB, Redis, Entity Framework Core
Cloud & DevOps: Docker, Kubernetes, Terraform, Jenkins, AWS, CI/CD, Linux, Git, GitHub

Featured Projects

CloudSight – Cloud Observability Platform (Group Project) Code | Live Demo | 2025 – 2026

Technologies: *Node.js, Express.js, React, Python, Docker, AWS (Amplify, EC2, RDS, ECR), PostgreSQL, Redis, Nginx, CI/CD*

- Contributed to a collaborative full-stack cloud observability platform for proactive monitoring, anomaly tracking, and incident management of web applications.
- Developed the automated anomaly detection process and threshold-based incident tracking workflows with multi-tier severity classification.
- Architected an automated CI/CD and deployment pipeline using GitHub Actions, Amazon ECR, and Docker Compose on EC2 behind an Nginx reverse proxy, with AWS Amplify frontend hosting and private Amazon RDS.

Tunnix – Self-Hosted Developer Tunneling & Ingress Platform Code | Live Demo | 2026

Technologies: *Go (Golang), WebSockets, TypeScript, Bun, Hono, React 18, Vite, Docker, AWS (EC2, CloudFront, Amplify, S3), Nginx, SQLite (WAL)*

- Developed a production-grade developer tunneling platform as an open-source alternative to Ngrok, securely exposing local HTTP services to the public internet via bi-directional WebSocket frame multiplexing.
- Engineered a high-throughput Go ingress gateway and cross-platform CLI agent (`tunnix`) for low-latency request/response streaming and local port forwarding.
- Architected a Bun/Hono control plane with SQLite in WAL mode, a 4-tier token security model, and a real-time React 18 dashboard for live tunnel telemetry and custom subdomain management.
- Automated production deployment and edge routing leveraging AWS EC2, CloudFront, Amplify, S3, Nginx reverse proxying, and automated Let's Encrypt SSL certificates.

AWS K3s OpenTelemetry Observability Lab Code | 2025

Technologies: *AWS EC2, K3s, Kubernetes, OpenTelemetry Collector, Honeycomb, Docker, Linux*

- Provisioned a production-grade K3s Kubernetes cluster on AWS EC2, deploying a realistic OpenTelemetry Demo microservices system with AWS Security Group network isolation, namespace-level CPU/memory resource quotas, and liveness/readiness probes for automated self-healing.
- Deployed a single centralized OpenTelemetry Collector pipeline to ingest, filter, and batch distributed traces, metrics, and logs across all microservices using OTLP with standardized W3C trace context propagation.
- Configured telemetry export pipelines to Honeycomb dashboards for system visualization, high-cardinality p95/p99 latency bottleneck tracing, and blameless SRE diagnostic workflows.
- Exposed the demo frontend via a fixed Kubernetes NodePort with stable external access, enforcing security-first defaults by using AWS Security Groups to restrict inbound traffic to only the UI and outbound OTLP telemetry ports.

WarehousePOS – Desktop Point of Sale & Warehouse Management System Code | Jan 2026 – Present

Technologies: *C#, .NET 10, WPF, MVVM, EF Core, SQLite, Dependency Injection, Moq, xUnit, Serilog*

- Designed a modular monolith desktop application with strict Clean Architecture separation across Domain, Application, Infrastructure, and UI layers.
- Implemented robust transactional state machines for purchase orders and sales checkout, guaranteeing ACID compliance and zero unrecorded inventory adjustments.
- Established a high code-quality standard with zero-warning compilation (`TreatWarningsAsErrors`), automated unit/integration tests with xUnit & Moq, and single-file self-contained deployment.
- Managed schema evolution and data persistence using EF Core with SQLite, configuring comprehensive audit logs and daily disaster-recovery database backups.

Certifications & Courses

CCNA (Cisco Certified Network Associate) (Ongoing)

AWS Cloud Essentials (Ongoing)

LFS158: Introduction to Kubernetes: The Linux Foundation · Architecture, Deployments & Pod Networking (Ongoing)

Supervised Machine Learning: Regression and Classification: DeepLearning.AI & Stanford Online

LFS101: Introduction to Linux: The Linux Foundation

Introduction to Python & NumPy: Foundations in Data Structures & Scientific Computing

Leadership & Extracurricular Activities

Batch Representative | Faculty of Information Technology, University of Moratuwa 2026 – Present

Programme Committee Member – Riseup Mora 2026 | University of Moratuwa 2026

Senior Prefect | H/North Kanumuldeniya National School 2019 – 2020
